Step-by-Step Approach to Windshield Impact Analysis Using ANSYS

Conducting a windshield impact analysis involves a series of meticulously planned steps. Each phase ensures that the simulation results are reliable and actionable.

1. Problem Definition and Objective Setting

Before beginning, clearly define the scope of the study:

- Impact type (e.g., stone chip, pedestrian collision, rollover).
- Impact velocity and angle.
- Material properties and structural constraints.

- Geometry Creation: Use CAD tools (e.g., ANSYS DesignModeler, SolidWorks) to develop accurate geometries, including glass, adhesive layers, and framing.
- Simplification: Remove unnecessary details that do not influence impact behavior to optimize computational efficiency.
- Mesh Generation: Generate a high-quality finite element mesh. Use finer elements in regions of expected high stress concentration, such as edges and impact zones.

3. Material Property Assignment

Accurate material modeling is crucial. For windshields:

- Glass: Typically modeled as brittle, with properties such as Young?s modulus (~70 GPa), Poisson?s ratio (~0.22), density (~2,500 kg/m³), and fracture criteria.
- Adhesives & Laminates: Use polymer models with elastic-plastic behavior.
- Support Structures: Define their stiffness and damping characteristics.

In ANSYS, material models can be customized to include damage and fracture properties, such as cohesive zone modeling for crack propagation.

4. Boundary Conditions and Constraints

Apply realistic boundary conditions to mimic actual vehicle mounting:

- Fixation points representing the frame attachment.
- Contact definitions between glass and supports or other components.
